## Summary of the Survey

## 1. Purpose of the National Health and Nutrition Survey (NHNS)

This survey aimed to clarify the physical conditions, nutrient intake, and lifestyle of citizens based on the Health Promotion Act (Law No. 103, enacted in 2002) and to obtain basic data for the comprehensive promotion of their health.

## 2. Participants

In the Comprehensive Survey of Living Conditions in 2018 (approximately 2,000 areas with 60,000 households and 146,000 family members), the participants included households and family members (aged 1 year and over as of November 1, 2018) in 300 areas, who were stratified and randomly extracted from the general census areas.

The following households and family members were excluded from this survey:
<Households>
-Households of which the heads were not Japanese.
-Households that were provided with delivered/prepared meals three times a day.
-One-person households in a live-in situation or residing in dormitories provided with meals.
<Family Members>
-Infants aged 11 months or younger.
-Persons who were unable to eat regular meals, including home care patients taking only fluids or drugs due to illness.
-Those who were not having meals together with the rest of the family.
-Those who were absent from the household, including migrant workers and those who were (a) working away from home, (b) away on business for a long period ( 3 months or more), (c) studying away from home, (d) admitted to a social welfare facility (including nursing care facilities), (e) admitted to a hospital for a long period, (f) put out to nurse, (g) imprisoned, and (h) not living together.
3. Purpose and period of survey

### 3.1 Survey items and target age

This survey consisted of a physical examination, a dietary survey, and a lifestyle habits questionnaire survey. The age indicated in the survey was based on the participants' age as of November 1, 2018. The survey items and the target age were as follows.

### 3.1.1 Physical examination

A) Height (aged 1 year and over)
B) Body weight (aged 1 year and over)
C) Abdominal circumference (aged 20 years and over)
D) Blood pressure: systolic and diastolic blood pressure (aged 20 years and over) measured twice a day.
E) Blood tests (aged 20 years and over)
F) Medical interview (aged 20 years and over) regarding the following variables:

Drugs used
Antihypertensive
Anti-arrhythmic
Cholesterol lowering
Antihyperlipidemic (triglyceride)
Iron supplements for treatment of iron deficiency anemia
Diagnosis and treatment
Diagnosis of diabetes
Treatment for diabetes
Status of treatment: insulin or other oral drugs for treatment of diabetes mellitus
Status of treatment: regular blood glucose tests or lifestyle improvement education in hospital
Regular exercise habit
Presence of restrictions for exercise due to medical reasons
Frequency of exercise per week

## Average exercise duration

Duration of regular exercise habit

### 3.1.2 Dietary survey (aged 1 year and over)

A) Household status: Name, birth date, sex, pregnant (gestational age) or lactating women, and occupation.
B) Meal classification for each family member on the day of the survey (meals cooked at home, home meal replacement, buying cooked food, using food delivery services, eating out, meals provided at school/workplace, etc.).
C) Food intake: Dish name, food name, volume, waste volume and proportional distribution by each household member.
D) Daily physical activity (the number of steps in a day, aged 20 years and over).

### 3.1.3 Lifestyle habit questionnaire (aged 20 years and over)

The participants were provided with a self-administered questionnaire, in which they answered questions about eating habits, physical activity, exercise, resting (sleep), alcohol intake, smoking, and dental health.
Further, socio economic status, such as household income, was examined as an important item in 2018.

### 3.2 Survey period

## The survey was performed in November 2018.

A) Physical examination: Date on which the highest participation could be achieved, considering the circumstances in the national census areas (several dates were established).
B) Dietary survey: One day, excluding Sunday and holidays.
C) Lifestyle habits questionnaire: During the survey period (November 2018).

## 4. Organizations involved in the survey

The survey system was as follows:

## 5. Data analyses

The comments related to the evaluation of results, such as "significantly higher (or lower, increased, or decreased)" and "with no significant change", were made based on the statistical tests (level of statistical significance defined as $\mathrm{p}<$ $0.05)$. The details are presented below.

### 5.1 Analysis regarding annual changes

The trend of the past 10 years was calculated using age-adjusted values based on the 2010 Census population, using the three age categories ( $65-74$ years, $75-84$ years, and 85 years and over ${ }^{1}$ ) for the proportion of malnutrition (BMI $\leq 20$ $\mathrm{kg} / \mathrm{m}^{2}$ ) in individuals aged 65 years and over and the six age categories ( $20-29$ years, $30-39$ years, $40-49$ years, 50-59 years, 60-69 years, and 70-79 years ${ }^{1}$ ) for other outcomes. Then, the Joinpoint Regression Program was performed using the mean/proportion and standard error for each year ${ }^{2}$. In these analyses, the adjusted national values were used for the 2012 and 2016 surveys $^{3}$.

### 5.2 Analysis between annual results

A trend test for annual results was conducted using a multivariate regression analysis with adjustment for age (six categories: 20-29 years, $30-39$ years, $40-49$ years, 50-59 years, 60-69 years, and 70-79 years).

### 5.3 Analysis of income and lifestyle/diet

The values of income and lifestyle/diet were estimated with adjustment for age (four categories: 20-39 years, 40-59 years, $60-69$ years, and 70 years and over) and number of household members (five categories: $1,2,3,4$, and 5 or more). The number of household members was estimated based on the response of a household head to question no. 12 in a lifestyle habits questionnaire. The proportions were estimated using a direct method, while means were estimated using the analysis of covariance. Comparison across household income was conducted by a multivariate logistic regression (for proportions) or analysis of covariance (for means) using the category of $6,000,000$ yen and over as a reference.

Results of NHNS Japan, 2016 (https://www.mhlw.go.jp/bunya/kenkou/eiyou/dl/h26-houkoku.pdf).

## 6. Collection of samples and results

The results were analyzed by the National Institutes of Biomedical Innovation, Health and Nutrition. Of 5,032 target households for the survey, 3,268 households that responded to the questions regarding household status in the dietary survey questionnaire were included in the analysis.

Number of samples collected according to age

| Men and Women | PhysicalExamination |  | Blood Test |  | Dietary Survey |  | Daily step counts |  | Lifestyle Questionnaire |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 7. Others

- The number of analyzed participants is shown in parentheses in the figures and tables.
- Because the values listed in this report were rounded off, the breakdown total may not match the total number.

## Summary of the Results Part I. Socioeconomic status and lifestyle

## 1. Income and lifestyle

The results of comparison of the participants' lifestyle (diet, exercise, smoking, alcohol consumption, sleep, medical checkup, physical condition, and number of teeth) by household income (less than 2,000,000 yen, 2,000,000 to less than $4,000,000$ yen, $4,000,000$ to less than $6,000,000$ yen, and $6,000,000$ yen or more) are described as follows:

1. The mean salt intake was significantly lower in men with a household income of less than $2,000,000$ yen than in men with a household income of $6,000,000$ yen or more. The mean vegetable intake was significantly lower in men with household incomes of less than $2,000,000$ yen and $2,000,000$ to less than $4,000,000$ yen than in men with a household income of $6,000,000$ yen or more. Furthermore, the proportion of those consuming less than 100 g of fruits was significantly higher in women with a household income of less than $2,000,000$ yen than in women with a household income of $6,000,000$ yen or more.
2. The mean daily step counts were significantly lower in men with a household income of less than $2,000,000$ yen than in men with a household income of $6,000,000$ yen or more. Compared with women with a household income of 6,000,000 yen or more, women in other household income categories (less than 2,000,000 yen, 2,000,000 to less than $4,000,000$ yen, and $4,000,000$ to less than $6,000,000$ yen) had significantly lower mean daily step counts.
3. The proportion of regular smokers was significantly higher in men with household incomes of less than $2,000,000$ yen and $2,000,000$ to less than $4,000,000$ yen than in men with a household income of $6,000,000$ yen or more. For women, the proportion of regular smokers was significantly higher in those with a household income of less than $2,000,000$ yen than in those with a household income of $6,000,000$ yen or more.
4. The proportion of those who consumed alcohol at a level that increases the risk of lifestyle-related diseases was significantly lower in men with household incomes of less than $2,000,000$ yen and $4,000,000$ to less than $6,000,000$ yen than in men with a household income of $6,000,000$ yen or more.
5. The proportion of those without adequate rest during sleep was significantly higher in women with a household income of less than $2,000,000$ yen than in women with a household income of $6,000,000$ yen or more.
6. Compared with those with a household income of $6,000,000$ yen or more, the proportion of those without medical checkup was significantly higher in both men and women in other a household income of categories (less than $2,000,000$ yen, $2,000,000$ to less than $4,000,000$ yen, and $4,000,000$ to less than $6,000,000$ yen).
7. The proportion of underweight was significantly higher in men with a household income of $2,000,000$ to less than $4,000,000$ yen than in men with a household income of $6,000,000$ yen or more.
8. Compared with men with a household income of $6,000,000$ yen or more, the proportion of those with less than 20 teeth was significantly higher in men in other a household income of categories (less than 2,000,000 yen, 2,000,000 to less than $4,000,000$ yen, and $4,000,000$ to less than $6,000,000$ yen). For women, the proportion was significantly higher in those with household incomes of less than $2,000,000$ yen and $2,000,000$ to less than $4,000,000$ yen $t$ with a household income of $6,000,000$ yen or more.

Table 1. Status of annual income of the households included in the analysis

|  | n of households | $\%$ |
| :--- | ---: | ---: |
| Total | 2,913 | - |
| Less than 2,000,000 yen | 617 | 21.1 |
| $2,000,000$ yen to less than 4,000,000 yen | 917 | 31.5 |
| $4,000,000$ yen to less than 6,000,000 yen | 580 | 19.9 |
| $6,000,000$ yen or more | 799 | 27.4 |

* Excluding 353 households that responded "I don't know" to question no. 13 from the 3,087 households with a valid response to question no. 13 in the lifestyle questionnaire.

Table 2. Income and lifestyle (aged 20 years and over)
${ }^{1}$ Adjusted for age (four categories: 20-39 years, 40-59 years, 60-69 years, and 70 years and over) and number of household members (five categories: $1,2,3,4$, and 5 or more). The proportions were estimated using a direct method, while means were estimated using the analysis of covariance.
${ }^{2}$ Income refers to household income during the past year (including tax) based on the response to question no. 13 in a lifestyle habit questionnaire.
${ }^{3}$ Household income was applied to each of the household members. Comparison between household income was conducted by a multivariate logistic regression (for proportions) or analysis of covariance (for means) using the category of 6,000,000 yen and over as a reference: * $\mathrm{p}<0.05$.

* "Those who did not exercise regularly" refers to participants except for "those who exercised regularly (those who performed physical activities for 30 minutes or longer per session, twice a week or more for at least one year)."
* "Regular smokers" refer to those who reported smoking every day or sometimes.
* "Those who consumed alcohol at a level that increases the risk of lifestyle-related diseases" refer to men and women who consumed 40 g or more and 20 g or more of pure alcohol daily, respectively. This included:
(1) Men who consumed 360 mL or more of sake every day, 360 mL or more 5 to 6 times a week, 540 mL or more 3 to 4 times a week, 900 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.
(2) Women who consumed 180 mL or more of sake every day, 180 mL or more 5 to 6 times a week, 180 mL or more 3 to 4 times a week, 540 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.
* "Those without adequate rest from sleep" refer to those who responded "not enough" or "no sleep" to the question about sleep.
* "Those without medical checkup" refer to those who did not undergo a medical checkup in the previous year.

## 2. Income and diet

## 1. Important criteria for food choice

- The proportion of those who responded "taste", "nutritious", and "seasonality" as important criteria for food choice was significantly lower in both men and women with a household income of less than $2,000,000$ yen than in those with a household income of 6,000,000 yen or more.

## 2. Frequency of eating balanced diets with staple foods, main dishes, and side dishes

- The proportion of those who eat balanced diets with staple foods, main dishes, and side dishes twice per day or more "almost every day" was significantly lower in both men and women with a household income of less than 2,000,000 yen than in those with a household income of $6,000,000$ yen or more. Furthermore, the proportion of those who responded "rarely" was significantly higher in both men and women with a household income of less than 2,000,000 yen than in those with a household income of $6,000,000$ yen or more.

## 3. Barriers to consuming balanced diets composed of staple foods, main dishes, and side dishes

- Among those who consumed balanced diets composed of staple foods, main dishes, and side dishes twice per day or more "less than 5 times/week," the proportion of those who knew that balanced diets include staple foods, main dishes, and side dishes was significantly lower in men with a household income of less than 2,000,000 yen than in men with a household income of $6,000,000$ yen or more.
- The proportion of those who responded "dietary cost" as a barrier to consuming balanced diets composed of staple foods, main dishes, and side dishes was significantly higher in both men and women with a household income of less than $2,000,000$ yen than in those with a household income of $6,000,000$ yen or more. Meanwhile, the proportion of those responded "frequent eating out" was significantly lower in both men and women with a household income of less than $2,000,000$ yen than in those with a household income of $6,000,000$ yen or more.

## 4. Dietary intake

- Intakes of meat and milk were significantly lower in both men and women with a household income of less than $2,000,000$ yen than in those with a household income of $6,000,000$ yen or more.
- Energy intake was significantly lower in both men and women with a household income of less than 2,000,000 yen than in those with a household income of $6,000,000$ yen or more.

Table 3. Income and important criteria for food choice (aged 20 years and over)

|  |  | Household income |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

${ }^{1}$ Included were those aged 20 years and over who participated in the dietary survey and were derived from a household whose head responded to questions 12 and 13 in a lifestyle habit questionnaire. Excluded were households with more than one member who responded to questions 12 and 13 or households whose head responded "unknown" to question no. 13.
${ }^{2}$ Adjusted for age (four categories: 20-39 years, 40-59 years, 60-69 years, and 70 years and over) and number of household members (five categories: $1,2,3,4$, and 5 or more). The proportions were estimated using direct method, while means were estimated using the analysis of covariance.
${ }^{3}$ Household income was applied to each of the household members. Comparison between household income was conducted by a multivariate logistic regression (for proportions) or analysis of covariance (for means) using the category of 6,000,000 yen and over as a reference: ${ }^{*} \mathrm{p}<0.05$.

## 3. Working hours and lifestyles

For average working hours, the proportion of those with 40-48 working hours/week was highest in men, while the proportion of those with 1-39 working hours/week was highest in women.
With regard working hours, the proportion of those who did not undergo medical checkup was higher in both men and women with 1-39 working hours/week, while the proportion of obesity was higher in both men and women with more than 60 working hours/week.

[^1]
## Part II. Results of basic items <br> Chapter 1. Physical condition and diabetes

## 1. Obesity and underweight

The proportion of obesity ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) was $32.2 \%$ in men and $21.9 \%$ in women with no significant change over the past 10 years in both sexes.
The proportion of underweight ( $\mathrm{BMI}<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ ) was $3.7 \%$ in men and $11.2 \%$ in women with no significant change over the past 10 years in both sexes. Additionally, the proportion of underweight was $19.8 \%$ in women aged 20-29 years.
The proportion of malnutrition ( $\mathrm{BMI} \leq 20 \mathrm{~kg} / \mathrm{m}^{2}$ ) in elderly aged 65 years and over was $10.3 \%$ for men and $20.3 \%$ for women with no significant change over the past 10 years in both sexes. With regard to age category, the proportion was higher in men and women aged 85 years and over.

* Evaluation of obesity: body mass index (BMI $\left[\mathrm{kg} / \mathrm{m}^{2}\right]$ : body weight $[\mathrm{kg}](\text { height }[\mathrm{m}])^{2}$ ) was used to evaluate obesity (Obesity Criteria-Reviewing Committee of Japan Society for the Study of Obesity, 2011).

Figure 3-1. Annual changes in the proportion of obesity (BMI $\geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) (aged 20 years and over) (2008-2018)

Figure 3-2. Annual changes in the age-adjusted proportion of obesity (BMI $\geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) (aged 20 years and over) (2008-2018)

Figure 4. Proportion of obesity ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) (aged 20 years and over, based on age and sex)

Figure 6-2. Annual changes in the age-adjusted malnutrition $\left(\mathrm{BMI} \leq 20 \mathrm{~kg} / \mathrm{m}^{2}\right)$ (aged 65 years and over) (2008-2018)

Figure 7. Proportion of malnutrition $\left(\mathrm{BMI} \leq 20 \mathrm{~kg} / \mathrm{m}^{2}\right)$ (aged 65 years and over, men and women, based on age)

## 2. Diabetes

The proportion of "those in whom diabetes is strongly suspected" was $18.7 \%$ in men and $9.3 \%$ in women with no significant change over the past 10 years in both sexes. With regard to age, the proportion was higher in the older age groups.

* "Those in whom diabetes is strongly suspected" was defined as participants with a hemoglobin A1c (NGSP) value of $6.5 \%$ or higher (or a hemoglobin A1c [JDS] value of $6.1 \%$ or higher before 2012) or those who responded "yes" to the question "Have you ever received diabetes treatment?" among those with a hemoglobin A1c value and valid responses to "diagnosis of diabetes", "treatment for diabetes", and "status of treatment"

Figure 8-1. Annual changes in the proportion of "those in whom diabetes is strongly suspected" (aged 20 years and over) (2008-2018)

Figure 8-2. Annual changes in the age-adjusted proportion of "those in whom diabetes is strongly suspected" (aged 20 years and over) (2008-2018)

Figure 9. Proportion of "those in whom diabetes is strongly suspected" (aged 20 years and older, based on age and sex)

## 3. Blood pressure

The mean systolic blood pressure was 134.7 mmHg in men and 127.9 mmHg in women. These values have significantly decreased over the past 10 years in both sexes.
The proportion of those with a systolic blood pressure of 140 mmHg or higher was $36.2 \%$ in men and $26.0 \%$ in women. These values have significantly decreased over the past 10 years in both sexes.

Figure 10-1. Annual changes in the mean systolic blood pressure (aged 20 years and over) (20082018)

Figure 11-1. Annual changes in the proportion of those with a systolic blood pressure of 140 mmHg or higher (aged 20 years and over) (2008-2018)

Figure 11-2. Annual changes in the age-adjusted proportion of those with a systolic blood pressure of 140 mmHg or higher (aged 20 years and over) (2008-2018)

## 4. Blood cholesterol

The proportion of those with a serum total cholesterol level of $240 \mathrm{mg} / \mathrm{dL}$ or higher was $12.2 \%$ in men and $21.1 \%$ in women. These values have significantly increased over the past 10 years in women but not in men.
The mean serum non HDL cholesterol level was $141.8 \mathrm{mg} / \mathrm{dL}$ in men and $142.6 \mathrm{mg} / \mathrm{dL}$ in women with no significant change over the past 10 years in both sexes.

Figure 12-1. Annual changes in the proportion of those with serum total cholesterol level of 240 $\mathrm{mg} / \mathrm{dL}$ and over (aged 20 years and over) (2008-2018)

Figure 12-2. Annual changes in the age-adjusted proportion of those with serum total cholesterol level of $240 \mathrm{mg} / \mathrm{dL}$ and over (aged 20 years and over) (2008-2018)

Figure 13-2. Annual changes in the age-adjusted mean serum non HDL cholesterol level (aged 20 years and over) (2008-2018)
*non HDL cholesterol ( $\mathrm{mg} / \mathrm{dL}$ ) = total cholesterol ( $\mathrm{mg} / \mathrm{dL}$ ) -HDL cholesterol $(\mathrm{mg} / \mathrm{dL})$

## Chapter 2. Nutrition/dietary habits

## 1. Salt intake

The mean salt intake was 10.1 g in the total participants, and 11.0 g in men and 9.3 g in women. These values have significantly decreased over the past 10 years in all participants as well as men and women. With regard to age, the highest mean intake was observed in men and women aged 60-69 years.

Figure 14-1. Annual changes in the mean salt intake (aged 20 years and over) (2008-2018)

Figure 15. Mean salt intake (aged 20 years and over, based on age and sex)

## 2. Vegetable Intake

The mean vegetable intake was 281.4 g in the total participants, and 290.9 g in men and 273.3 g in women with no significant change over the past 10 years. With regard to age, those aged 20-49 years had lower vegetable intake, while those aged 60 years and over had higher vegetable intake in both men and women.

Figure 16-1. Annual changes in the mean vegetable intake (aged 20 years and older) (2008-2018)

Figure 16-2. Annual changes in the age-adjusted mean vegetable intake (aged 20 years and older) (2008-2018)

Figure 17. Mean vegetable intake (aged 20 years and over, based on age and sex)

## 3. Food choice

## 3-1. Important criteria for food choice

The proportion of those who responded "taste" as important criteria for food choice was the highest in both sexes and was $74.4 \%$ in men and $77.4 \%$ in women. The proportion of those who responded "nutritious", "seasonality", "safety", "freshness", and "price" varied widely between sexes.

(\%)

## 3-2. Intake of balanced diets

The proportion of those who consumed balanced diets composed of staple foods, main dishes, and side dishes twice per day or more "almost every day" was $45.4 \%$ in men and $49.0 \%$ in women. With regard to age, the proportion tended to be lower in the younger age group.
Among those who consumed balanced diets composed of staple foods, main dishes, and side dishes twice per day or more "less than 5 times/week", the proportion of those who knew that balanced diets include staple foods, main dishes, and side dishes was $88.7 \%$ in men and $95.5 \%$ in women. Among those with this knowledge, the proportion of those who responded "takes much effort to prepare meal" as a barrier to consuming balanced diets composed of staple foods, main dishes, and side dishes was the highest.

Figure 19. Frequency of eating balanced diets with staple foods, main dishes, and side dishes twice per day or more (aged 20 years and over, based on age and sex).

Table 9. Proportion of those who knew that balanced diets include staple foods, main dishes, and side dishes among those who eat balanced diets composed of staple foods, main dishes, and side dishes twice per day or more "less than 5 times/week"* (aged 20 years and over, based on age and sex).

Figure 20. Barriers to consuming balanced diets with staple foods, main dishes, and side dishes (aged 20 years and over, based on sex)

[^3]
## Chapter 3. Physical activity, exercise, and sleep

## 1. Exercise habits

The proportion of those who exercised regularly was $31.8 \%$ in men and $25.5 \%$ in women. These values have significantly decreased over the past 10 years in women but not in men. With regard to age, the lowest proportion was observed in men (17.6\%) and women (7.8\%) aged 20-29 years.

Figure 21-1. Annual changes in the proportion of those who exercised regularly (aged 20 years and over) (2008-2018)

Figure 21-2. Annual changes in the age-adjusted proportion of those who exercised regularly (aged 20 years and over) (2008-2018)

* "Those who exercised regularly" refer to those who performed physical activities for 30 minutes or longer per session, twice a week or more for at least one year.

Figure 22. Proportion of those who exercised regularly (aged 20 years and over, based on age and sex)

## 2. Daily step counts

The mean daily step counts were 6,794 in men and 5,942 in women with no significant change over the past 10 years in both sexes. With regard to age, the mean daily step counts were 7,644 in men and 6,705 in women aged $20-64$ years, while the corresponding values were 5,417 in men and 4,759 women aged 65 years and over.

Figure 23-2. Annual changes in the age-adjusted mean daily step counts (aged 20 years and over) (2008-2018)

* Those taking less than 100 steps or 50,000 steps and over were excluded from the 2012 survey.

Figure 24. Mean daily step counts (aged 20 years and over, based on age and sex)

* Those taking less than 100 steps or 50,000 steps and over were excluded.

## 3. Sleep

The proportion of those without adequate rest from sleep in the previous month was $21.7 \%$ in the total participants. The proportion has significantly increased across the surveys from 2009 to 2018.
For mean sleeping duration in the previous month, the proportion of those with 6-7 hours of sleep/day was the highest: $34.5 \%$ in men and $34.7 \%$ in women. With regard to age, the proportion of those with less than 6 hours of sleep/day was more than $40 \%$ in men aged $30-59$ years and women aged $40-69$ years.

Figure 25. Annual changes in the proportion of those without adequate rest from sleep (aged 20 years and over, total of men and women, based on age) (2009, 2012, 2014, 2016 and 2018)

* "Those without adequate rest from sleep" refer to those who responded "not enough" or "no sleep" to the question about sleep.
* The age-adjusted proportion of those without adequate rest from sleep were $19.4 \%$ in $2009,16.3 \%$ in $2012,21.7 \%$ in $2014,20.9 \%$ in 2016, and $23.4 \%$ in 2018. The proportion has significantly increased across the survey from 2009 to 2018.

Figure 26. Proportion of mean sleep duration per day (aged 20 years and over, based on age and sex)

## Chapter 4. Alcohol consumption and smoking status

## 1. Alcohol consumption

The proportion of those who consumed alcohol at a level that increases the risk of lifestyle-related diseases was $15.0 \%$ in men and $8.7 \%$ in women. The proportion has significantly increased over the past 8 years (except for 2013 without survey) in women but not in men. With regard to age, the highest proportion was observed in men (22.4\%) and women ( $15.6 \%$ ) aged $50-59$ years.

Figure 27-1. Annual changes in the proportion of those who consumed alcohol at a level that increases the risk of lifestyle-related diseases (aged 20 years and over) (2010 to 2018)

Figure 27-2. Annual changes in the age-adjusted proportion of those who consumed alcohol at a level that increases the risk of lifestylerelated diseases (aged 20 years and over) (2010 to 2018)

* No survey was conducted in 2013.
* "Those who consumed alcohol at a level that increases the risk of lifestyle-related diseases" refer to men and women who consumed 40 g and more and 20 g or more of pure alcohol daily, respectively. This included:
(1) Men who consumed 360 mL or more of sake every day, 360 mL or more 5 to 6 times a week, 540 mL or more 3 to 4 times a week, 900 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.
(2) Women who consumed 180 mL or more of sake every day, 180 mL or more 5 to 6 times a week, 180 mL or more 3 to 4 times a week, 540 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.
* The age-adjusted proportion of men and women who consumed alcohol at a level that increases the risk of lifestyle-related diseases was $15.3 \%$ and $8.0 \%$ in $2010,16.5 \%$ and $8.9 \%$ in $2011,14.6 \%$ and $7.9 \%$ in $2012,15.7 \%$ and $9.5 \%$ in $2014,13.6 \%$ and $8.6 \%$ in 2015 , $14.7 \%$ and $9.5 \%$ in $2016,14.8 \%$ and $9.3 \%$ in 2017 , and $15.1 \%$ and $9.4 \%$ in 2018 , respectively. The proportion has significantly increased over the past 8 years (except for 2013 without survey) in women but not in men.

Figure 28. Proportion of those who consumed alcohol at a level that increases the risk of lifestyle-related diseases (aged 20 years and over, based on age and sex)

## 2. Smoking status

The proportion of regular smokers was $17.8 \%$ in the total participants, and $29.0 \%$ in men and $8.1 \%$ in women. The proportion has significantly decreased over the past 10 years in both sexes. With regard to age, the highest proportion was observed in men aged $30-69$ years ( $>30 \%$ ).

* "Regular smokers" refer to those who reported smoking every day or sometimes (after 2013), smoking every day or sometimes in the past month (in respondents who reported smoking cigarettes) (from 2011 to 2012), and smoking (or had smoked) 100 cigarettes or more in a total or 6 months or longer (from 2008 to 2010).

Figure 30. Proportion of regular smokers (aged 20 years and over, based on age and sex)

With regard to the types of tobacco products, the proportion of those who smoked "cigarettes" among regular smokers was $77.0 \%$ in men and $84.9 \%$ in women, while the proportion of those who smoked "heated tobacco products" was $30.6 \%$ in men and $23.6 \%$ in women.
With regard to the combination of types of tobacco products, the proportion of regular smokers who smoked "only cigarettes", "only heated tobacco products", and "both cigarettes and heated tobacco products" was $68.1 \%, 22.1 \%$, and $8.5 \%$ in men and $76.1 \%, 14.8 \%$, and $8.8 \%$ in women, respectively.

Figure 31. Types of tobacco products smoked by regular smokers (aged 20 years and over, based on age and sex)

* "Regular smokers" refer to those who reported smoking every day or sometimes.
* Multiple answers allowed from "cigarettes", "heated tobacco products", and "other".

Figure 32. Combination of types of tobacco products smoked by regular smokers (aged 20 years and over, based on age and sex)

* "Both cigarettes and heated tobacco products" refer to those who reported smoking both "cigarettes" and "heated tobacco products" as well as one person who reported smoking "other", "cigarettes", and "heated tobacco products".

## 3. Willingness to quit smoking

Among regular smokers, the proportion of those willing to quit smoking was $32.4 \%$ in the total participants, and $30.6 \%$ in men and $38.0 \%$ in women.

Figure 33-1. Annual changes in the proportion of those willing to quit smoking among regular smokers (aged 20 years and over) (20082018)

* No survey was conducted in 2012.

Figure 34. Proportion of those willing to quit smoking among regular smokers (aged 20 years and over, based on age and sex)

## 4. Passive smoking

With regard to places, the proportion of participants who were exposed to passive smoking in the past month (except for regular smokers) was the highest in "restaurants" ( $36.9 \%$ ), followed by "street" $(30.9 \%)$ and "amusement places" $(30.3 \%)$; the proportion of passive smoking in these places was more than $30 \%$. In "home", "workplace", "school", "restaurants", "amusement places", "administrative agency", and "medical institutions", the proportion has significantly decreased across the surveys from 2003 to 2018.

Figure 35. Proportion of those exposed to passive smoking (aged 20 years and over, except for regular smokers) (2003, 2008, 2011, 2013, 2015, 2016, 2017 and 2018).

* Results of 2003, 2008, 2011, 2013, 2015, 2016, 2017, and 2018 surveys are shown (from left to right) for all places, except for "public transport", "street", and "outdoor space used by children", for which, results of 2013, 2015, 2016, 2017, and 2018 surveys are shown.
* "Regular smokers" refer to those who reported smoking every day or sometimes.
* "Those exposed to passive smoking" refer to those exposed to passive smoking every day at home or once a month or more out of home.
* Those who worked in schools, restaurants, and amusement places and were exposed to passive smoking responded "workplace".
* The specific place or occasion in which the respondents were exposed to passive smoking was unknown.

## Chapter 5. Dental health (oral health)

## 1. Dental health (oral health)

The proportion of those with 20 teeth and over was $76.9 \%$ in the total participants. The proportion has significantly increased across the surveys from 2004 to 2018.
The proportion of those with gingival inflammation was $21.3 \%$ in the total participants. The proportion has significantly decreased across the surveys from 2004 to 2018.

Figure 36. Annual changes in the proportion of those with 20 teeth and over (aged 20 years and over, total of men and women, based on age) $(2004,2009,2014$ and 2018)

* The age-adjusted proportion (total number) of those with 20 teeth and over was $73.6 \%$ in $2004,75.0 \%$ in $2009,78.6 \%$ in 2014 , and $81.9 \%$ in 2018. The proportion has significantly increased across the surveys from 2004 to 2018.

Figure 37. Annual changes in the proportion of those with gingival inflammation (aged 20 years and over, total of men and women, based on age) $(2004,2009,2014$ and 2018)

* "Those with gingival inflammation" refer to those who responded "swollen gums" or "bleeding during brushing teeth" to the question regarding the status of the gums.
* The age-adjusted proportion (total number) of those with gingival inflammation was $29.7 \%$ in $2004,25.7 \%$ in 2009 , and $24.2 \%$ in 2014, and $22.3 \%$ in 2018. The proportion has significantly decreased across the surveys from 2004 to 2018.

Abbreviations: RE, retinol equivalents; NE , niacin equivalents
${ }^{1}$ Including only $\alpha$-tocopherol.
${ }^{2}$ Salt equivalents $=\mathrm{Na}(\mathrm{mg}) \times 2.54 / 1,000$
${ }^{3}$ Nutrient values are shown as the mean value per person per day.
${ }^{4}$ Carbohydrate-energy ratio $=100-$ protein-energy ratio - fat-energy ratio.

## 2. Intake by food groups

* Food values are shown in grams and as the mean values per person per day

[^0]:    ${ }^{1}$ Included were those who responded to questions 1 and 2 in a lifestyle habit questionnaire and were derived from a household whose head responded to questions 12 and 13. Excluded were households with more than one member who responded to questions 12 and 13 or households whose head responded "I don't know" to question no. 13.
    ${ }^{2}$ Adjusted for age (four categories: 20-39 years, 40-59 years, 60-69 years, and 70 years and over) and number of household members (five categories: $1,2,3,4$, and 5 or more). The proportions were estimated using a direct method, while means were estimated using the analysis of covariance.
    ${ }^{3}$ Income refers to household income during the past year (including tax) based on the response to the question no. 13 in a lifestyle habits questionnaire.
    ${ }^{4}$ Household income was applied to each of the household members. Comparison between household income was conducted by a multivariate logistic regression (for proportions) or analysis of covariance (for means) using the category of $6,000,000$ yen and over as a reference: * $\mathrm{p}<0.05$.

    * This footnote applies to Tables 3-5 and Figure 1.

[^1]:    * "Those who did not exercise regularly" refers to participants except for "those who exercised regularly (those who performed physical activities for 30 minutes or longer per session, twice a week or more for at least one year)."
    * "Regular smokers" refer to those who reported smoking every day or sometimes.
    * "Those who consumed alcohol at a level that increases the risk of lifestyle-related diseases" refer to men and women who consumed 40 g or more and 20 g or more of pure alcohol daily, respectively. This included:
    (1) Men who consumed 360 mL or more of sake every day, 360 mL or more 5 to 6 times a week, 540 mL or more 3 to 4 times a week, 900 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.
    (2) Women who consumed 180 mL or more of sake every day, 180 mL or more 5 to 6 times a week, 180 mL or more 3 to 4 times a week, 540 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.
    * "Those without adequate rest from sleep" refer to those who responded "not enough" or "no sleep" to the question about sleep.
    * "Those without medical checkup" refer to those who did not undergo a medical checkup in the previous year.

[^2]:    * The breakdown total is not $100 \%$ because multiple answers were allowed.

[^3]:    * Multiple answers were allowed.
    * Those who knew that balanced diets include staple foods, main dish, and side dish among those who consumed balanced diets composed of staple foods, main dishes, and side dishes twice per day or more "less than 5 times/week"
