## Summary of the Survey

## 1. Purpose of the National Health and Nutrition Survey (NHNS)

This survey aimed to clarify the physical conditions, nutrient intake, and lifestyle of citizens based on the Health Promotion Act (Law No. 103, enacted in 2002) and to obtain basic data for the comprehensive promotion of their health.

## 2. Participants

In the Comprehensive Survey of Living Conditions in 2019 (approximately 11,000 areas with 300,000 households and 720,000 family members), the participants included households and family members (aged 1 year and over as of November 1, 2019) in 300 areas, who were stratified and randomly extracted from the general census areas. Of the selected census areas, four were excluded due to the influence of typhoon No. 19 in 2019.

The following households and family members were excluded from this survey:
<Households>
-Households of which the heads were not Japanese.
-Households that were provided with delivered/prepared meals three times a day.
-One-person households in a live-in situation or residing in dormitories provided with meals.
<Family Members>
-Infants aged 11 months or younger.
-Persons who were unable to eat regular meals, including home care patients taking only fluids or drugs due to illness.
-Those who did not have meals together with the rest of the family.
-Those who were absent from the household, including migrant workers and those who were (a) working away from home, (b) away on business for a long period ( 3 months or more), (c) studying away from home, (d) admitted to a social welfare facility (including nursing care facilities), (e) admitted to a hospital for a long period, (f) put out to nurse, (g) imprisoned, and (h) not living together.

## 3. Purpose and period of survey

### 3.1 Survey items and target age

This survey consisted of a physical examination, a dietary survey, and a lifestyle habits questionnaire survey. The age indicated in the survey was based on the participants' age as of November 1, 2019. The survey items and target age were as follows.

### 3.1.1 Physical examination

A) Height (aged 1 year and over)
B) Bodyweight (aged 1 year and over)
C) Abdominal circumference (aged 20 years and over)
D) Blood pressure: systolic and diastolic blood pressure (aged 20 years and over) measured twice a day.
E) Blood tests (aged 20 years and over)
F) Medical interview (aged 20 years and over) regarding the following variables:

Drugs used
Antihypertensive
Anti-arrhythmic
Cholesterol lowering
Antihyperlipidemic (triglyceride)
Iron supplements for treatment of iron deficiency anemia
Diagnosis and treatment
Diagnosis of diabetes
Treatment for diabetes
Status of treatment: insulin or other oral drugs for treatment of diabetes mellitus
Status of treatment: regular blood glucose tests or lifestyle improvement education in hospital
Regular exercise habit
Presence of restrictions for exercise due to medical reasons

## Frequency of exercise per week

Average exercise duration
Duration of regular exercise habit

### 3.1.2 Dietary survey (aged 1 year and over)

A) Household status: Name, birth date, sex, pregnant (gestational age) or lactating women, and occupation
B) Meal classification for each family member on the day of the survey (meals cooked at home, home meal replacement, buying cooked food, using food delivery services, eating out, meals provided at school/workplace, etc.)
C) Food intake: Dish name, food name, volume, waste volume and proportional distribution by each household member
D) Daily physical activity (the number of steps per a day, aged 20 years and over)

### 3.1.3 Lifestyle habit questionnaire (aged 20 years and over)

The participants were provided with a self-administered questionnaire, in which they answered questions about eating habits, physical activity, exercise, resting (sleep), alcohol intake, smoking, and dental health. Further, the social environmental factors were examined as an important item in 2019.
An online survey has been introduced since 2019. Participants could opt to answer the lifestyle habit questionnaire using their PC or smartphone, at home or workplace.

### 3.2 Survey period

The survey was performed in November 2019
A) Physical examination: Date on which the highest participation could be achieved, considering the circumstances in the national census areas (several dates were established)
B) Dietary survey: One day, excluding Sundays and holidays
C) Lifestyle habits questionnaire: During the survey period (November 2019)

## 4. Organizations involved in the survey

The survey system was as follows:

## 5. Data analyses

The comments related to the evaluation of results, such as "significantly higher (or lower, increased, or decreased)" and "with no significant change", were made based on the statistical tests (level of statistical significance defined as p < $0.05)$. The details are presented below.

### 5.1 Analysis regarding annual changes

The trend of the past 10 years was calculated using age-adjusted values based on the 2010 Census population, using the three age categories ( $65-74$ years, $75-84$ years, and 85 years and over ${ }^{1}$ ) for the proportion of malnutrition (BMI $\leq 20$ $\mathrm{kg} / \mathrm{m}^{2}$ ) in individuals aged 65 years and over and the six age categories ( $20-29$ years, $30-39$ years, $40-49$ years, 50-59
years, 60-69 years, and 70-79 years ${ }^{1}$ ) for other outcomes. Then, the Joinpoint Regression Program was performed using the mean/proportion and standard error for each year ${ }^{2}$. In these analyses, adjusted national values were used for the 2012 and 2016 surveys ${ }^{3}$.

### 5.2 Analysis between annual results

A trend test for annual results was conducted using a multivariate regression analysis with adjustment for age (six categories: 20-29 years, $30-39$ years, $40-49$ years, 50-59 years, 60-69 years, and 70-79 years).

Results of NHNS Japan, 2016 (https://www.mhlw.go.jp/bunya/kenkou/eiyou/dl/h26-houkoku.pdf)

## 6. Collection of samples and results

The results were analyzed by the National Institutes of Biomedical Innovation, Health and Nutrition. Of the 4,465 target households for the survey, 2,836 households that responded to at least one question in the survey questionnaires were included in the analysis.

Number of samples collected according to age

| Men and Women | Physical Examination |  | Blood Test |  | Dietary Survey |  | Steps per day |  | Lifestyle questionnaire |  |

## 7. Others

- The number of analyzed participants is shown in parentheses in the figures and tables.
- Because the values listed in this report were rounded off, the total breakdown may not match the total number.

## Summary of the Results

## Part I. Social environmental factors and lifestyle

## 1. Intention to improve eating habits

For the intention to improve eating habits, the proportion of those who responded "I don't intend to improve my eating habits though I'm interested" was highest among both men ( $24.6 \%$ ) and women ( $25.0 \%$ ).
With regard to BMI categories, the proportion of those who responded "I don't intend to improve my eating habits though I'm interested" was highest among obese and normal-weight participants, while the proportion of those who responded "I don't have to improve my eating habits because my eating habits have no problems" was highest among underweight participants.
With regard to salt intake categories, the proportion of those who responded "I don't intend to improve my eating habits though I'm interested" was highest, irrespective of salt intake.

Figure 1. Intention to improve eating habits (aged 20 years and over, based on age and sex)

Figure 2. Intention to improve eating habits according to BMI (aged 20 years and over, based on sex)

* Body mass index (BMI $\left[\mathrm{kg} / \mathrm{m}^{2}\right]$ : body weight $[\mathrm{kg}] /(\text { height }[\mathrm{m}])^{2}$ ) was used to evaluate weight status: $<18.5$ for underweight, 18.5$<25$ for normal-weight, and $\geq 25$ for obese.

Figure 3. Intention to improve eating habits according to salt intake (aged 20 years and over, based on sex)

* "Decrease in mean salt intake to $8 \mathrm{~g} / \mathrm{day}$ " is one of the targets of Health Japan 21 (the second term).

## 2. Barriers to healthy eating habits

For the barriers to healthy eating habits, the proportion of those who responded "none" was highest (35.3\%), followed by "busy with work/housework/child care" (27.5\%) and "too troublesome" ( $25.3 \%$ ).
With regard to the stage of improvement of eating habits, the proportion of those who responded "none" was highest among those who responded "I'm not interested in improving my eating habits", "I don't intend to improve my eating habits though I'm interested", and "I have improved my eating habits for more than/less than six months." Meanwhile, the proportion of those who responded "busy with work/housework/child care" was highest among those who responded "I intend to improve my eating habits within the next (six) month(s)."

Figure 4. Intention to improve eating habits (aged 20 years and over, based on age)

* The total breakdown is not $100 \%$ because multiple answers are allowed.

Table 1. Barriers to healthy eating habits (aged 20 years and over, based on age and sex)

* Participants included were those who chose any answer except for "I don't have to improve my eating habits because my eating habits have no problems" and who answered the question for barriers to healthy eating habits.
* The total breakdown is not $100 \%$ because multiple answers are allowed.
* The shaded cells show the most selected point for each stage of improvement of eating habits.

## 3. Sources of information for daily diet

For sources of information for daily diet, the proportion of those who responded "television" was highest (52.3\%), the highest values observed in men aged 50 years and over and women aged 30 years and over. This was followed by those who responded "family member" ( $36.6 \%$ ), with the highest values observed in men aged $20-59$ years and women aged 20-29 years.
With regard to the stage of improving eating habits, the proportion of men who responded "none" was highest among men who responded "I'm not interested in improving my eating habits"; the proportion of men who responded "television" was highest among men who responded "I don't intend to improve my eating habits though I'm interested", "I intend to improve my eating habits within the next six months", or "I have improved my eating habits for more than six months"; and the proportion of men who responded "family member" was highest among men who responded "I intend to improve my eating habits within the next month", "I have improved my eating habits for less than six months", or "I don't intend to improve my eating habits because my eating habits have no problems". Meanwhile, the proportion of those who responded "television" was highest in women irrespective of the stage of improving eating habits.

* The answers for which less than $5 \%$ of participants responded (i.e., "public health centers", "elderly care facilities", "health education session and seminar", "sports facilities", "advertisement", "club activities in the workplace or community", "other", and "none") were not included the analysis.
* The total breakdown is not $100 \%$ because multiple answers are allowed.
* The shaded cells show the most selected point for each stage of improvement of eating habits.

## 4. Eating out and the use of takeaway food, home delivery meal service, and health food

The proportion of those who eat out at least once a week was $41.6 \%$ in men and $26.7 \%$ in women; these values were higher in the younger age groups. The proportion of those who used takeaway food at least once a week was $47.2 \%$ in men and $44.3 \%$ in women; these values were higher in participants aged $20-59$ years. The proportion of those who used home delivery meal services at least once a week was $5.8 \%$ in men and $4.6 \%$ in women.
The proportion of those who used health food was $30.2 \%$ in men and $38.2 \%$ in women; these values were highest in both men and women aged 60-69 years. In terms of the consumption of health food, the highest response was "complement protein intake" for men aged 20-29 years and "complement vitamin intake" for women aged 20-29 years. Meanwhile, the proportion of those who responded "health maintenance and promotion" was highest among other age groups.

## 5. Intention to improve exercise habits

For the intention to improve exercise habits, the proportion of those who responded "I don't intend to improve my exercise habits though I'm interested" was highest among both men (23.9\%) and women ( $26.3 \%$ ).
With regard to BMI categories, the proportion of those who responded "I don't intend to improve my exercise habits though I'm interested" was highest among obese and normal-weight participants. Meanwhile, the proportion of those who responded "I'm not interested in improving my exercise habits" was highest in underweight men and the proportion of those who responded "I don't intend to improve my exercise habits though I'm interested" was highest in underweight women.
With regard to the status of exercise habits, the proportion of those who responded "I have improved my exercise habits for more than six months" was highest among both men (34.3\%) and women ( $40.5 \%$ ) who exercise regularly. The proportion of those who responded "I do not intend to improve my exercise habits though I'm interested" was highest among both men (31.2\%) and women ( $28.2 \%$ ) who did not exercise regularly.

Figure 11. Intention to improve exercise habits (aged 20 years and over, based on age and sex)

Figure 12. Intention to improve exercise habits according to BMI (aged 20 years and over, based on sex)

Figure 13. Intention to improve exercise habits according to the status of exercise habits (aged 20 years and over, based on sex)

## 6. Barriers to regular exercise habits

Regarding with the stage of improving exercise habits, the proportion of those who responded "busy with job/housework/child care" as the barriers to regular exercise habits was highest among those who responded "I don't intend to improve my exercise habits though I'm interested", "I intend to improve my exercise habits within the next (six) month(s)", and "I have improved my exercise habits for less than six months". The proportion of those who responded "none" was highest among those who responded "I'm not interested in improving my exercise habits" and "I have improved my exercise habits for more than six months".

## 7. Emergency stocks of food

In total, $53.8 \%$ of households stored emergency stocks of food and these values were highest in the Kanto I area (72.3\%) and lowest in the Minamikyushu area (33.1\%).

Among households which store emergency stocks of food, the proportion of households which store emergency stocks for at least 3 days was $69.9 \%$.
The type of emergency stocks of food was staple food ( $80.0 \%$ ), main/side dishes ( $79.0 \%$ ), and beverages $(90.3 \%)$.

Figure 15. Proportion of households which store emergency stocks of food (aged 20 years and over, based on area)

* Households included in the analysis were that they stored emergency stocks of food (1,359 households)

* The total breakdown is not $100 \%$ because multiple answers are allowed.

## Part II. Results of basic items <br> Chapter 1. Physical condition and diabetes

## 1. Obesity and underweight

The proportion of obesity ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) was $33.0 \%$ in men and $22.3 \%$ in women. These values have significantly increased since 2013 in men, while there has been no significant change over the past 10 years in women.
The proportion of underweight ( $\mathrm{BMI}<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ ) was $3.9 \%$ in men and $11.5 \%$ in women, with no significant change over the past 10 years in both sexes. Additionally, the proportion of underweight was $20.7 \%$ in women aged 20-29 years.
The proportion of malnutrition ( $\mathrm{BMI} \leq 20 \mathrm{~kg} / \mathrm{m}^{2}$ ) in elderly aged 65 years and over was $12.4 \%$ for men and $20.7 \%$ for women with no significant change over the past 10 years in both sexes. With regard to the age category, the proportion was higher in men and women aged 85 years and over

* Evaluation of obesity: body mass index (BMI $\left[\mathrm{kg} / \mathrm{m}^{2}\right]$ : body weight $[\mathrm{kg}] /(\text { height }[\mathrm{m}])^{2}$ ) was used to evaluate obesity (Obesity Criteria-Reviewing Committee of Japan Society for the Study of Obesity, 2011).

Figure 18-1. Annual changes in the proportion of obesity
(BMI $\geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) (aged 20 years and over) (2009-2019)

Figure 22. Proportion of malnutrition $\left(\mathrm{BMI} \leq 20 \mathrm{~kg} / \mathrm{m}^{2}\right)$ (aged 65 years and over, men and women, based on age)

## 2. Diabetes

The proportion of "those in whom diabetes is strongly suspected" was $19.7 \%$ in men and $10.8 \%$ in women with no significant change over the past 10 years in both sexes. This proportion was higher in the older age groups.

* "Those in whom diabetes is strongly suspected" was defined as participants with a hemoglobin A1c (NGSP) value of 6.5\% or higher (or a hemoglobin A1c [JDS] value of $6.1 \%$ or higher before 2012) or those who responded "yes" to the question "Have you ever received diabetes treatment?" among those with a hemoglobin A1c value and valid responses to "diagnosis of diabetes," "treatment for diabetes," and "status of treatment."

Figure 23-1. Annual changes in the proportion of "those in whom diabetes is strongly suspected" (aged 20 years and over) (2009-2019)

Figure 23-2. Annual changes in the age-adjusted proportion of "those in whom diabetes is strongly suspected" (aged 20 years and over)
(2009-2019)

Figure 24. Proportion of "those in whom diabetes is strongly suspected" (aged 20 years and older, based on age and sex)

## 3. Blood pressure

The mean systolic blood pressure was 132.0 mmHg in men and 126.5 mmHg in women. These values have significantly decreased over the past 10 years in both sexes.
The proportion of those with a systolic blood pressure of 140 mmHg or higher was $29.9 \%$ in men and $24.9 \%$ in women. These values have significantly decreased over the past 10 years in both sexes.

* Mercury-free sphygmomanometers have been used for measurement since 2019.

Figure 25-1. Annual changes in the mean systolic blood pressure (aged 20 years and over) (20092019)

Figure 26-1. Annual changes in the proportion of those with a systolic blood pressure of 140 mmHg or higher (aged 20 years and over) (2009-2019)

Figure 26-2. Annual changes in the age-adjusted proportion of those with a systolic blood pressure of 140 mmHg or higher (aged 20 years and over) (2009-2019)

## 4. Blood cholesterol

The proportion of those with a serum total cholesterol level of $240 \mathrm{mg} / \mathrm{dL}$ or higher was $12.9 \%$ in men and $22.4 \%$ in women. These values have significantly increased over the past 10 years in women but not in men.
The mean serum non HDL cholesterol level was $141.9 \mathrm{mg} / \mathrm{dL}$ in men and $145.9 \mathrm{mg} / \mathrm{dL}$ in women with no significant change over the past 10 years in both sexes.

Figure 27-1. Annual changes in the proportion of those with serum total cholesterol level of 240 $\mathrm{mg} / \mathrm{dL}$ and over (aged 20 years and over) (2009-2019)

Figure 27-2. Annual changes in the age-adjusted proportion of those with serum total cholesterol level of $240 \mathrm{mg} / \mathrm{dL}$ and over (aged 20 years and over) (2009-2019)

Figure 28-2. Annual changes in the age-adjusted mean serum non HDL cholesterol level (aged 20 years and over) (2009-2019)
*non $^{\text {HDL }}$ cholesterol $(\mathrm{mg} / \mathrm{dL})=$ total cholesterol $(\mathrm{mg} / \mathrm{dL})-$ HDL cholesterol $(\mathrm{mg} / \mathrm{dL})$

## Chapter 2. Nutrition/dietary habits

## 1. Salt intake

The mean salt intake was 10.1 g in all participants, 10.9 g in men, and 9.3 g in women. These values have significantly decreased over the past 10 years in men. A similar trend was observed from 2009 to 2015 in women, with no significant change since 2015. The highest mean intake was observed in men and women aged 60-69 years.

Figure 29-1. Annual changes in the mean salt intake (aged 20 years and over) (2009-2019)

Figure 29-2. Annual changes in the age-adjusted mean salt intake (aged 20 years and over) (20092019)

Figure 30. Mean salt intake (aged 20 years and over, based on age and sex)

## 2. Vegetable Intake

The mean vegetable intake was 280.5 g in all participants, 288.3 g in men, and 273.6 g in women with no significant change over the past 10 years. Those aged $20-49$ years had a lower vegetable intake, while those aged 60 years and over had a higher vegetable intake in both men and women.

Figure 31-1. Annual changes in the mean vegetable intake (aged 20 years and older) (2009-2019)

Figure 31-2. Annual changes in the age-adjusted mean vegetable intake (aged 20 years and older) (20092019)

Figure 32. Mean vegetable intake (aged 20 years and over, based on age and sex)

## Chapter 3. Physical activity, exercise, and sleep

## 1. Exercise habits

The proportion of those who exercised regularly was $33.4 \%$ in men and $25.1 \%$ in women. These values have significantly decreased over the past 10 years in women but not in men. The lowest proportion was observed in men aged $40-49$ years ( $18.5 \%$ ) and women aged $30-39$ years ( $9.4 \%$ ).

Figure 33-2. Annual changes in the age-adjusted proportion of those who exercised regularly (aged 20 years and over) (2009-2019)

* "Those who exercised regularly" refer to those who performed physical activities for at least 30 minutes per session, at least twice a week, for at least one year.

Figure 34. Proportion of those who exercised regularly (aged 20 years and over, based on age and sex)

## 2. Daily step counts

The mean daily step counts were 6,793 in men and 5,832 in women. These values have significantly decreased over the past 10 years in women but not in men. The mean daily step counts were 7,864 in men and 6,685 in women aged 20-64 years, and 5,396 in men and 4,658 women aged 65 years and over.

Figure 35-1. Annual changes in the mean daily step counts (aged 20 years and over) (20092019)

* Those taking less than 100 steps or 50,000 steps and over were excluded from the 2012 survey.

Figure 36. Mean daily step counts (aged 20 years and over, based on age and sex)

* Those taking less than 100 steps or 50,000 steps and over were excluded.

## 3. Sleep

For the mean sleeping duration in the previous month, the proportion of those with 6-7 hours of sleep per day was highest among both men ( $32.7 \%$ ) and women ( $36.2 \%$ ). The proportion of those with less than 6 hours of sleep per day was $37.5 \%$ in men and $40.6 \%$ in women. This proportion was more than $40 \%$ in men aged $30-59$ years and women aged 40-69 years.
For the quality of sleep, the proportion of those who responded "I feel drowsy during the day" was highest among both men and women aged 20-59 years, while the proportion of those who responded "wake up at night" was highest among women aged 70-79 years.
For barriers to ensure sufficient sleep duration, the highest response was "using a mobile phone, texting, and/or playing video game before bedtime" for men and women aged 20-29 years, "job" for men aged 30-49 years, and "child care" for women aged 30-39 years.

* Those whose mean sleeping duration during the past month was less than 6 hours/day refers to those who responded that their mean sleeping duration during the past month was less than 5 hours/day and 5-6 hours/day.

Figure 37. Proportion of mean sleep duration per day (aged 20 years and over, based on age and sex)

## Chapter 4. Alcohol consumption and smoking status

## 1. Alcohol consumption

The proportion of those who consumed alcohol at a level that increases the risk of lifestyle-related diseases was $14.9 \%$ in men and $9.1 \%$ in women. The proportion has significantly increased over the past 9 years (except for 2013 without survey) in women but not in men. The highest proportion was observed in men aged $40-49$ years ( $21.0 \%$ ) and women (16.8\%) aged 50-59 years.

Figure 38-1. Annual changes in the proportion of those who consumed alcohol at a level that increases the risk of lifestyle-related diseases (aged 20 years and over) (2010 to 2019)

Figure 38-2. Annual changes in the age-adjusted proportion of those who consumed alcohol at a level that increases the risk of lifestylerelated diseases (aged 20 years and over) (2010 to 2019)

* No survey was conducted in 2013.
* "Those who consumed alcohol at a level that increases the risk of lifestyle-related diseases" refer to men and women who consumed 40 g and more and 20 g or more of pure alcohol daily, respectively. This included:
(1) Men who consumed 360 mL or more of sake every day, 360 mL or more 5 to 6 times a week, 540 mL or more 3 to 4 times a week, 900 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.
(2) Women who consumed 180 mL or more of sake every day, 180 mL or more 5 to 6 times a week, 180 mL or more 3 to 4 times a week, 540 mL or more once or twice a week, or 900 mL or more 1 to 3 times a month.

Figure 39. Proportion of those who consumed alcohol at a level that increases the risk of lifestyle-related diseases (aged 20 years and over, based on age and sex)

## 2. Smoking status

The proportion of regular smokers was $16.7 \%$ in all participants, $27.1 \%$ in men, and $7.6 \%$ in women. The proportion has significantly decreased over the past 10 years in both sexes. The highest proportion was observed in men aged $30-$ 69 years (>30\%).

Figure 40-2. Annual changes in the age-adjusted proportion of regular smokers (aged 20 years and over) (2009-2019)

* "Regular smokers" refer to those who reported smoking every day or sometimes (after 2013), smoking every day or sometimes in the past month (in respondents who reported smoking cigarettes) (from 2011 to 2012), and smoking (or had smoked) 100 cigarettes or more in a total or 6 months or longer (from 2009 to 2010).

Figure 41. Proportion of regular smokers (aged 20 years and over, based on age and sex)

With regard to the types of tobacco products, the proportion of those who smoked "cigarettes" among regular smokers was $79.0 \%$ in men and $77.8 \%$ in women, while the proportion of those who smoked "heated tobacco products" was $27.2 \%$ in men and $25.2 \%$ in women.
With regard to the combination of types of tobacco products, the proportion of regular smokers who smoked "only cigarettes", "only heated tobacco products", and "both cigarettes and heated tobacco products" was $71.8 \%, 20.3 \%$, and $6.9 \%$ in men and $72.6 \%, 20.4 \%$, and $4.8 \%$ in women, respectively.

Figure 42. Types of tobacco products smoked by regular smokers (aged 20 years and over, based on age and sex)

* "Regular smokers" refer to those who reported smoking every day or sometimes.
* Multiple answers allowed from "cigarettes", "heated tobacco products", and "other".

Figure 43. Combination of types of tobacco products smoked by regular smokers (aged 20 years and over, based on age
and sex)

* "Both cigarettes and heated tobacco products" refer to those who reported smoking both "cigarettes" and "heated tobacco products."

## 3. Willingness to quit smoking

Among regular smokers, the proportion of those willing to quit smoking was $26.1 \%$ in all participants, $24.6 \%$ in men, and $30.9 \%$ in women. This proportion has significantly decreased over the past 10 years in men, but not in women.

Figure 44-1. Annual changes in the proportion of those willing to quit smoking among regular smokers (aged 20 years and over) (20092019)

* No survey was conducted in 2012.

Figure 44-2. Annual changes in the age-adjusted proportion of those willing to quit smoking among regular smokers (aged 20 years and over) (2009-2019)

Figure 45. Proportion of those willing to quit smoking among regular smokers (aged 20 years and over, based on age and sex)

## 4. Passive smoking

With regard to places, the proportion of participants who were exposed to passive smoking in the past month (except for regular smokers) was highest in "restaurants" (29.6\%), followed by "amusement places" and "street" (27.1\%). The proportion has significantly decreased for all the places investigated across the surveys from 2003 to 2019.

Figure 35. Proportion of those exposed to passive smoking (aged 20 years and over, except for regular smokers) (2003, 2008, 2011, 2013, 2015, 2016, 2017, 2018, and 2019).

* Results of 2003, 2008, 2011, 2013, 2015, 2016, 2017, 2018, and 2019 surveys are shown (from left to right) for all places, except for "public transport", "street", and "outdoor space used by children", for which, results of 2013, 2015, 2016, 2017, 2018, and 2019 surveys are shown.
* "Regular smokers" refer to those who reported smoking every day or sometimes.
* "Those exposed to passive smoking" refer to those exposed to passive smoking every day at home or once a month or more out of home.
* Those who worked in schools, restaurants, and amusement places and were exposed to passive smoking responded "workplace".
* The specific place or occasion in which the respondents were exposed to passive smoking was unknown.

## Chapter 5. Dental health (oral health)

## 1. Dental health (oral health)

The proportion of participants who did not have the difficulty of chewing any food items was $75.0 \%$ in total participants when compared with the findings of 2009, 2013, 2015, 2017, and 2019 surveys. The proportion has significantly increased among all age categories.
Regarding oral status while eating, the proportion of those with the difficulty of chewing by both sides of the back teeth was more than $40 \%$ in all participants, $45.8 \%$ in individuals aged 60 to 69 years, and $43.3 \%$ in individuals aged 70 years and over. The proportion of those who reported the difficulty of chewing hard food items compared to half a year ago, suffocation while drinking tea and soups, and dry mouth was highest in individualsa aged 70 years and over and the values were $36.6 \%, 27.2 \%$, and $25.7 \%$, respectively.

Figure 47. Annual changes in the proportion of those without the difficulty of chewing any food items (aged 40 years and over, total of men and women, based on age) (2009, 2013, 2015, 2017, and 2019)

Figure 48. Oral status while eating (aged 20 years and over, total of men and women, based on age) (2009, 2013, 2015, 2017, and 2019)
*The proportion of those who reported "the difficulty of chewing hard food items compared to half a year ago", "suffocation while drinking tea and soups", "dry mouth", and "the difficulty of chewing by both sides of back teeth"

## Chapter 6. Community Ties

## 1. Community Ties

The proportion of those who agreed to "people around here are willing to help each other" was $50.1 \%$, with no significant difference when compared with the findings of 2011, 2015, and 2019 surveys. The proportion of those who agreed to "there is a strong bond between the community and myself" was $40.2 \%$. These values tended to be higher in the older age groups.
For social activities, the proportion of individuals who participated in community activities was highest among both men $(42.8 \%)$ and women ( $43.4 \%$ ). The propotion of individulas who participated in volunteer activities, sports activities, avocational activities, and other acitivities was $20 \%$.

Figure 49. Proportion of those who thought "people around here are willing to help each other" in 2011, 2015, and 2019 (aged 20 years and over, based on age, total of men and women).

${ }^{1}$ Abbreviation: RAE, retinol activity equivalents.
${ }^{2}$ Including only $\alpha$-tocopherol.
${ }^{3}$ Salt equivalents $=\mathrm{Na}(\mathrm{mg}) \times 2.54 / 1,000$
${ }^{4}$ Nutrient values are shown as the mean value per person per day.
${ }^{5}$ Carbohydrate-energy ratio $=100-$ protein-energy ratio - fat-energy ratio.

${ }^{1}$ Abbreviation: RAE, retinol activity equivalents.
${ }^{2}$ Including only $\alpha$-tocopherol.
${ }^{3}$ Salt equivalents $=\mathrm{Na}(\mathrm{mg}) \times 2.54 / 1,000$
${ }^{4}$ Nutrient values are shown as the mean value per person per day.
${ }^{5}$ Carbohydrate-energy ratio $=100-$ protein-energy ratio - fat-energy ratio.

* Food values are shown in grams and as the mean values per person per day

[^0]:    * The total breakdown is not $100 \%$ because multiple answers are allowed.
    * The shaded cells show the most selected point for each age category.

[^1]:    * The total breakdown is not $100 \%$ because multiple answers are allowed.
    * The shaded cells show the most selected point for each age category.

[^2]:    * The total breakdown is not $100 \%$ because multiple answers are allowed.
    * The shaded cells show the most selected point for each age category.

[^3]:    * Participants included were those who chose any answer except for "I don't have to improve my exercise habits because my exercise habits have no problems" and who answered the question for barriers to regular exercise habits.
    * The total breakdown is not $100 \%$ because multiple answers are allowed.
    * The shaded cells show the most selected point for each stage of improving exercise habits.

[^4]:    Prefectures included in each area:
    Hokkaido: Hokkaido
    Tohoku: Aomori, Iwate, Miyagi, Akita, Yamagata, and Fukushima
    Kanto I: Saitama, Chiba, Tokyo, and Kanagawa
    Kanto II: Ibaraki, Tochigi, Gunma, Yamanashi, and Nagano
    Hokuriku: Niigata, Toyama, Ishikawa, and Fukui Tokai: Gifu, Aichi, Mie, and Shizuoka
    Kinki I: Kyoto, Osaka, and Hyogo
    Kinki II: Nara, Wakayama, and Shiga
    Chugoku: Tottori, Shimane, Okayama, Hiroshima, and Yamaguchi
    Shikoku: Tokushima, Kagawa, Ehime, and Kochi
    Kitakyushu: Fukuoka, Saga, Nagasaki, and Oita
    Minamikyushu: Kumamoto, Miyazaki, Kagoshima, and Okinawa

[^5]:    * The total breakdown is not $100 \%$ because multiple answers are allowed.

[^6]:    *"Participating" refer to those who responded participating "a few times a year", " $1-3$ times per month", "once a week ", " $2-3$ times per week", or " $\geq 4$ times per week".
